CSCE 411: Report

Husain Alshehhi

February 19, 2014

In `frame_pool.C`, I tried to implement the `frame_pool` class. First, I tried to keep track of the frames I have within that space in memory I have. If I am given 0 as an input for `_info_frame_no`, I consider the starting frame. Then I clear all the frames.

In `get_frame`, I wasn't sure what to do. I am confident that I should look for a non-zero frame, but given that, I do not know what to return. I found some advice online, but it was non-understandable.

In `page_table.C`, I implemented `enable_paging` and `load` fine, according to the website. But I am not sure how to implement the rest. I looked online for help and read several manuals, but still the implementation we use in class is very different that anything I read.
